Experimental

Melting points were determined by using Kofler hot-stage apparatus (Reichert, Vienna, Austria). Glass capillaries were used and melting points are uncorrected. Aluminium TLC plates (20 × 20, 0.5 mm thick) precoated with silica gel 60 F_{254} (20x20 cm, 0.2 mm thick; E. Merck, Darmstadt, Germany) were used for TLC to check the purity of the compounds. Column chromatography (CC) was carried out using silica gel of 230-400 mesh (E.Merck, Darmstadt, Germany). Ceric sulphate and potassium permanganate solution s were used as visualization reagents. The UV spectra (λ_{max} nm) were recorded on Shimadzu UV-2700 spectrophotometer (Shimadzu, Japan) in EtOH. Mass Spectra was recorded on Bruker TOF Mass spectrometers (Billerica, USA) using electrospray ionisation (ESI). The ^{1}H NMR and ^{13}C NMR spectra were recorded on a Bruker DPX-400 NMR spectrometer (Billerica, USA) (400 MHz for ^{1}H and 100 MHz for ^{13}C-NMR), using $CDCl_3$ as solvent. Further assignments were made by DEPT, COSY, HMQC and HMBC experiments.
