## S1: Experimental Details

## S1.1: Essential Oils Extraction

The fresh flowers, leaves and stems of Z. striolatum were collected from Guizhou Province of China in September 2018. Dry flowers, leaves and stems were separately obtained by drying in a ventilated oven at a temperature of $50^{\circ} \mathrm{C}$ for 72 h . The dry $Z$. striolatum flowers, leaves and stems ( 800 g ) were separately subjected to hydrodistillation for 5 h using a Clevenger-type apparatus to obtain the essential oils. The essential oils were dried over anhydrous $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and stored in amber bottle at $4^{\circ} \mathrm{C}$ until further analysis.

## S1.2: Gas Chromatography (GC) Analysis of Essential Oils

Analysis of the essential oils was carried out by an Agilent 6890 gas chromatograph equipped with a flame ionization detector (FID) and a FB-5MSi capillary column ( $30 \mathrm{~m} \times 0.25 \mathrm{~mm}$ $\times 0.25 \mu \mathrm{~m}$ film thickness). The carrier gas helium was set at a flow rate of $1 \mathrm{~mL} / \mathrm{min}$. The injection volume was $1 \mu \mathrm{~L}$ and split injection was used (split ratio 1:20). GC oven temperature was kept at $58^{\circ} \mathrm{C}$ for 2 min then increased to $160^{\circ} \mathrm{C}$ at $3^{\circ} \mathrm{C}$ per min, and programmed to $310^{\circ} \mathrm{C}$ at a rate of $10^{\circ} \mathrm{C} / \mathrm{min}$ and then finally kept at $310^{\circ} \mathrm{C}$ for 5 min . The injector temperature was set at $250^{\circ} \mathrm{C}$.

## S1.3: Gas Chromatography-Mass Spectrometry (GC/MS) Analysis of Essential Oils

GC-MS analyses were performed on Hewlett Packard 6890 gas chromatograph fitted with a FB-5MSi fused silica column, equipped with a Hewlett Packard 5975C mass selective detector. GC parameters were the same as above. Mass spectra were operated in electron ionization (EI) mode at 70 eV with mass range ( $\mathrm{m} / \mathrm{z} 29$ to 500 ).

## S1.4: Identification of Chemical Constituents

The percentage of the chemical component of the essential oils was calculated by the peak area normalization method. The constituents of the essential oils were identified by their retention time, retention indices relative to $n$-alkanes ( $\mathrm{C}_{9}-\mathrm{C}_{30}$ ), and as well as by comparison of their mass spectra with those listed in literature, NIST 14 and Wiley 275 databases [1-4].

## S1.5: Cytotoxic Activity Test

Human leukemic cell line (K562), human prostatic carcinoma cell line (PC-3) and human lung cancer cell line (A549) were maintained in RPMI 1640 medium supplemented with $10 \%$ fetal bovine serum, 2 mM glutamine, and antibiotics ( $100 \mathrm{U} / \mathrm{mL}$ of penicillin and $100 \mathrm{U} / \mathrm{mL}$ of streptomycin). The cells were grown in a humidified incubator at $37^{\circ} \mathrm{C}$ with $5 \% \mathrm{CO}_{2}$ atmosphere. The cytotoxic activity was evaluated by MTT assay with slight modification [5]. The cells were seeded at a density of $5 \times 10^{3}$ cells per well in $80 \mu \mathrm{~L}$ of culture medium and incubated for 24 h before treatment. The essential oils were dissolved in DMSO, and afterwards serially double diluted with culture medium for use. The dilutions of the essential oils were added to the wells ( $20 \mu \mathrm{~L}$ ). The
microplates were incubated for 48 h . After incubation, the medium was removed and $10 \mu \mathrm{~L}$ of MTT ( $5 \mathrm{mg} / \mathrm{mL}$ in PBS) was added to each well and incubated for 4 h under the same culture conditions. Then, the MTT was removed and $150 \mu \mathrm{~L}$ DMSO was added to each well to solubilize the formazan crystals. After shaking for 10 min at room temperature, the optical density was measured at 490 nm using a microplate spectrophotometer (Bio-Rad Model 680, Hercules, CA, USA). The cytotoxic activity was expressed as the concentration of the essential oils inhibiting cell growth by $50 \%$ ( $\mathrm{IC}_{50}$ ). All experiments were performed in triplicate.

## S1.6: Statistical Analysis

The results of the tests were carried out in triplicate and expressed as the means $\pm$ SD. SPSS software (version 19.0) was used for statistical analysis. Data were compared by oneway analysis of variance (ANOVA) using Tukey's multiple range tests. Differences were considered to be significant at $\mathrm{p}<0.05$ level.
