---

**Abstract:** Fatty acids composition of seed oil of *Salvia viridis*, *S. hydrangea*, *S. blepharochleana*, *S. chianantha*, *S. staminea*, *S. hypergeia*, *S. cilicica*, *S. caespitosa*, *S. sclarea*, *S. cadmica*, *S. microstegia*, *S. pachystachys* and *S. verticillata* were analyzed by GC/MS. The main compound were found to be as linoleic acid (18:2; 12.8 % to 52.2 %), linolenic acid (18:3; 3.2 % to 47.7 %), oleic acid (18:1; 11.3 % to 25.6 %), palmitic acid (16:0; 0.7 % to 16.8 %) and stearic acid (18:0; 1.8 % to 4.8 %). A phylogenetic tree of species of *Salvia* were reported and compared to 18:3/18:2 ratio of the seed oils. Fatty acid composition of *Salvia* seed oils could be used as a chemotaxonomical marker.

**Key words:** *Salvia*; Fatty acid; Linoleic acid; Linolenic acid; chemotaxonomy

---

### 1. Introduction

There are 89 species and 93 taxa of *Salvia* recorded in the Flora of Turkey [1-4]. The ratio of endemism of species of *Salvia* in Turkey is 48 % and Anatolia is a major centre for the genus in Asia [1].

Fatty acid compositions of the *Salvia* species were reported in the literature. The genus *Salvia* belongs to the Nepetoideae subfamily of the Lamiaceae of angiosperms. The family has been characterized by the occurrence of linolenic, linoleic and oleic acids in their seeds oil [5,6]. Fatty acid compositions of the seed oils of *Salvia hispanica* L, [7-11] *S. sclarea* [12] and 25 Turkish *Salvia* species were reported in the literature and the main constituents of them were similar to other Nepetoideae subfamily members. The main fatty acid composition of reported 25 *Salvia* species were palmitic acid, oleic acid, linoleic acid and linolenic acid [6,13-14].

As part of our continuing studies of fatty acid composition of seed oils and chemotaxonomy of species of *Salvia* [5,14], we have now investigated fatty acid composition of 13 species of *Salvia*: *Salvia viridis*, *S. hydrangea*, *S. blepharochleana*, *S. chianantha*, *S. staminea*, *S. hypereggia*, *S. cilicica*, *S. caespitosa*, *S. sclarea*, *S. cadmica*, *S. microstegia*, *S. pachystachys* and *S. verticillata*, and continued the chemotaxonomic evaluation of 35 species of *Salvia* were reported.

## 2. Materials and Methods

### 2.1. Plant Material

*Salvia* species were collected during seed period. Locality, altitude, collection time and Herbarium number of Thirteen species of *Salvia* are follows: *Salvia viridis* (Osmaniye, 1600 m, June, 2004, ISTE 83384), *S. hydrangea* (İğdir, 1200 m, June, 2004, ISTE 83385), *S. blepharochleana* (Kayseri, 1700 m, June 2004, ISTE 83386), *S. chianantha* (Burdur, 1150 m, July 2004, ISTE 83387), *S. staminea* (Erzincan, 2200 m, July 2004, ISTE 83388) *S. hypergegia* (Adana, 900 m, June 2004, ISTE 83389), *S. cilicica* (K.Maraş, 1300 m, July 2004, ISTE 83390), *S. caespitosa* (Kayseri, 2400 m, June 2004, ISTE 83391), *S. sclarea* (Osmaniye, 900 m, June 2004, ISTE 83392), *S. cadmica* (Denizli, 1800 m, July 2004, ISTE 83393), *S. microstegia* (Kayseri, 1600 m, July 2004, ISTE 83394), *S. pachystachys* (Erzincan, 2250 m, July 2004, TD. ISTE 83395), *S. verticillata* (Sivas, 1200 m, August 2004, ISTE 83396). The voucher specimens were deposited in the Herbarium of ISTE and Department of Biology, Faculty of Arts and Science, Bahkesir University.

### 2.2. Sample Extraction and Derivatization

Seeds of species were separated from the rest of the aerial parts of the plants. The seeds of *Salvia viridis* (10.1 g), *S. hydrangea* (10.3 g), *S. blepharochleana* (8.2 g), *S. chianantha* (10.4 g), *S. staminea* (7.8 g), *S. hypergegia* (17.0 g), *S. cilicica* (9.8 g), *S. caespitosa* (8.6 g), *S. sclarea* (12.0 g), *S. cadmica* (10.0 g), *S. microstegia* (15.1 g), *S. pachystachys* (6.2 g) and *S. verticillata* (15.1 g) were extracted with hexane by using the Soxhlet extraction and the oil yields were 150 mg (1.5 %), 200 mg (1.9 %), 160 mg (1.9 %), 140 mg (1.3 %), 225 mg (2.9 %), 187 mg (1.1 %), 143 mg (1.5 %), 140 mg (1.6 %), 180 mg (1.5 %), 600 mg (6 %), 170 mg (1.1 %), 160 mg (2.6 %), 200 mg (1.3 %) respectively.

For the derivatization of free fatty acids: The seed oil (30 mg) was dissolved in toluene (1 mL) in a test tube and H<sub>2</sub>SO<sub>4</sub> in methanol (2ml, 1%) was then added. The mixtures was left overnight at 50 °C, then sodium chloride solution (5ml, 5%) was added and the required esters were extracted with hexane (2x 5 mL), then the organic layer was separated using Pasteur pipettes for both samples. The hexane layers were washed with potassium bicarbonate solution (4 ml, 2%) and dried over anhydrous Na<sub>2</sub>SO<sub>4</sub> and filtered. The organic solvent was removed under reduced pressure on a rotary evaporator to give fatty acid methyl esters [5,15].

For the derivatization of total fatty acids: 100 mg of the seed oil was refluxed in 0.1 M KOH solution in ethanol (2 mL) for 1 hour. The solution was cooled and 5 mL water was added. The aqueous mixture was neutralized with 0.5 mL HCl solution and extracted with hexane:diethyl ether (1:1; 3 x 5 mL). The organic layer was separated and washed with water (10 ml), dried over anhydrous Na<sub>2</sub>SO<sub>4</sub>. The organic solvent was removed under reduced pressure on a rotary evaporator to give fatty acid methyl esters [5-7]. Derivatization procedure was described above.

Meyer, (Ağrı) ;35. *S. cedronella* Boiss.(Denizli)

### 2.3. GC/MS conditions

The fatty acid methyl esters were analyzed using Trace 2000 GC series gas chromatography and Thermo mass spectrometer. SGE BPx70 column (60 m x 0.25mm,

0.25  $\mu\text{m}$  film thickness) was used. The carrier gas was helium at a rate of 1mL/min. GC oven temperature was kept at 100  $^{\circ}\text{C}$  for 5 min and programmed to 240  $^{\circ}\text{C}$  at a rate of 4  $^{\circ}\text{C}/\text{min}$  and kept constant at 240  $^{\circ}\text{C}$  for 5 min. The injection temperature and source temperature were 250  $^{\circ}\text{C}$  and 220  $^{\circ}\text{C}$ , respectively. MS interface temperature was 240  $^{\circ}\text{C}$ . The injection volume was 0.5  $\mu\text{L}$  with a split ratio of 1:30. EI/MS were taken at 70 eV ionization energy. Mass range was from m/z 50 to 650 amu. Scan time 0.5 sec. with 0.1 interscan delay. The library search carried out using NIST and Wiley GC-MS library and TÜBİTAK-UME library. Supelco<sup>TM</sup> 37 components FAME mixture (Catalog no:47885-U) were used for the comparison of the GC chromatograms. The relative percentage of separated compounds were calculated from Total Ion Chromatography by the computerized integrator.

### 3. Results and discussion

The main free fatty acids in the seeds of *Salvia* were determined as linoleic acid (18:2; 12.8 % to 52.2 %), linolenic acid (18:3; 2.9 % to 47.7 %), oleic acid (18:1; 11.3 % to 32.4 %), palmitic acid (16:0; 0.7 % to 16.8 %) and stearic acid (18:0; 1.8 % to 6.5 %) and, the main total acid composition of the reported species were determined as linoleic acid (18:2; 14.3 % to 52.2 %), linolenic acid (18:3; 3.2 % to 35.9 %), oleic acid (18:1; 13.7 % to 32.1 %), palmitic acid (16:0; 7.1 % to 14.5 %) and stearic acid (18:0; 2.5 % to 5.5 %) (Table.1)

In the Flora of Turkey, the Turkish species of *Salvia* were classified into seven subgroups. Using the shapes of leaves, calyx texture, the length and colour of corolla as criteria [1-2] The reported species were classified as follows; **2, 3, 8** and **12** (Group A), **10** (Group B), **4, 9** and **11** (Group D), **6** and **10** (Group E), **1,7** and **13** (Group F), **5, 7** and **11** (Group G) [2]. In our previous study, 18:3/18:2 ratio of seed oil of species of *Salvia* has been used as a taxonomic marker [6]. Linoleic acid, linolenic acid, oleic acid, palmitic acid and stearic acid were the main fatty acids in the majority of species of *Salvia* (Table 1). The ratio of linolenic acid to linoleic acid showed good agreement in each subgroup (Table 2). In this study, 18:3/18:2 (linolenic acid/linoleic acid) ratio for the species of Turkish *Salvia* were found in the ranges of 0.36-0.4 for species of Group A, 0.01-0.06 for species of Group B, 0.01-0.11 for Group C, 0.99 -2.17 for species of Group D, 0.01-0.58 for species Grup E, 0.82-1.31 for species of Group F, and 0.82-2.64 for species of Group G except, *S. aethiopis*.

<sup>a</sup>The bold number indicate the number of species of *Salvia* given in figure 1.

\*The 18:3/18:2 ratios of seed oil of species are given in parenthesis and the values were taken from the literature for species **14-35** [5-6,12-13].

<sup>ψ</sup>Groups A-G of species of *Salvia* were described in references [1-2]

In conclusion, the results of this study show that linolenic/linoleic acid mixtures with the ratios identified above from the seed oils of species of *Salvia* can be used as chemotaxonomical marker as described previously [14]
