Text S1: Detail experiments for Sugar analysis of compounds $\mathbf{1}$ and 2
Compounds 1-2 (each 2 mg ) were individually dissolved with $2 \mathrm{~mol} / \mathrm{LCF}_{3} \mathrm{COOH}$ ( 2 mL ) at $100^{\circ} \mathrm{C}$ for 8 h . After dilution with $\mathrm{H}_{2} \mathrm{O}(15 \mathrm{ml})$, the reaction mixture was extracted with EtOAc, yielding distinct EtOAc and $\mathrm{H}_{2} \mathrm{O}$ phases. The latter was concentrated under reduced pressure by repeated mixing with methanol until the solvent was completely evaporated. The residue was dissolved in pyridine solution ( 1 mL ) of L-cysteine methyl ester hydrochloride (2 $\mathrm{mg} / \mathrm{L}$ ). After heating at $60^{\circ} \mathrm{C}$ for 1 h , the solvent was evaporated under $\mathrm{N}_{2}$ protection. The reaction products were dissolved in the mixed solution of N -(trimethylsilyl)imidazole ( 0.2 mL ) and anhydrous pyridine ( 2 mL ), and the mixture was maintained at $60^{\circ} \mathrm{C}$ for 1 h , evaporated under a stream of $\mathrm{N}_{2}$, and dried in a vacuum. The residue was suspended in cyclohexane and water, the cyclohexane layer was the trimethylsilyl ether derivatives of monosaccharide. The mixture was filtered through a $0.45 \mu \mathrm{~m}$ membrane to remove the precipitate and analyzed by GC under the following conditions: HP-5 capillary column ( $30 \mathrm{~m} \times 0.32 \mathrm{~mm} \times 0.25 \mu \mathrm{~m}$ ); flame ionization detector; detector temperature $=280{ }^{\circ} \mathrm{C}$; injection temperature $=250{ }^{\circ} \mathrm{C}$; initial temperature $=100^{\circ} \mathrm{C}$ for 2 min , followed by an increase to $280^{\circ} \mathrm{C}$ at a rate of $10^{\circ} \mathrm{C} / \mathrm{min}$; final temperature $=280^{\circ} \mathrm{C}$ for 5 min ; and $\mathrm{N}_{2}$ gas as a carrier. The absolute configurations of sugars isolated from the hydrolysates of compounds $\mathbf{1 - 2}$ were determined by comparing the retention times $\left(\mathrm{t}_{\mathrm{R}}\right)$ of their trimethylsilyl-L-cysteine derivatives with those of authentic sugars prepared by a similar procedure. Retention times for authentic sugars after being derivatized were follows: D-glucose, 45.2 min , D-fucose, 35.2 min ; D-apiose, 11.2 min ; L-arabinose, 12.2 min and L-rhamnopyranose, 14.5 min , respectively.

## Text S2: Cytotoxicity assay

Cytotoxic was determined against HCT116, A549 and HepG2 tumor cell lines based on the MTT assay method in vitro, and 5 -fluorouracil ( $5-\mathrm{Fu}$ ) was used as the positive control. Briefly, $1 \times 10^{4} \mathrm{~mL}^{-1}$ cells were seeded into 96 -well plates and allowed to adhere for 24 h . Compounds 1-5 were dissolved in DMSO and diluted with complete medium to six concentration levels (from $0.001 \mathrm{mmol} \cdot \mathrm{L}^{-1}$ to $0.3 \mathrm{mmol} \cdot \mathrm{L}^{-1}$ ) for inhibition rate determination. After incubation at $37{ }^{\circ} \mathrm{C}$ for 24 h , the supernatant was removed before adding DMSO $(100 \mu \mathrm{~L})$ to each well. The inhibition rate (IR) and $\mathrm{IC}_{50}$ were calculated. Values are mean $\pm \mathrm{SD}, n=3, * *$ $p<0.01 \mathrm{vs}$. DMEM control.
